Make sure submissions are clearly labelled including address, name, and application type. Failure to do so may impact the timing of your application.

The above listed items are required to ensure that your application is given full consideration. An incomplete or improperly prepared application will not be accepted and may result in delays during the processing of the application. This application must be typed or printed in ink and completed in full.

Please review all of the important information summarised below.

Before your Application is Submitted

A pre-consultation meeting is not usually required for Committee of Adjustment applications; however, discussion with Planning Department staff prior to the submission of an application is **strongly encouraged**. The purpose of communicating with a planner **before** you submit your application is: to review your proposal / application, to discuss potential issues; and to determine the required supporting information and materials to be submitted with your application before it can be considered complete by staff. You might find it helpful to retain the services of an independent professional (such as a registered professional planner) to help you with your application. Information about the Official Plan and Zoning By-law can be found on the County website: www.norfolkcounty.ca/planning

After Your Application is Submitted

Once your payment has been received and the application submitted, in order for your application to be deemed complete all of the components noted above are required.

Incomplete applications will be identified and returned to the applicant. The *Planning Act* permits up to 30 days to review and deem an application complete.

Once your application has been deemed complete by the Planning Department, it is then circulated to public agencies and County departments for review and comment. A sign is also provided that is required to be posted on the subject lands that summarizes the application and identifies the committee meeting date. The comments received from members of the community will be included in the planning report and will inform any recommendations in relation to the application.

If the subject lands are located in an area that is regulated by either the Long Point Region Conservation Authority or by the Grand River Conservation Authority an additional fee will be required if review by the applicable agency is deemed necessary. A separate cheque payable to the Long Point Region Conservation Authority or the Grand River Conservation Authority is required in accordance with their fee schedule at the same time your application is submitted.

Additional studies required as part of the complete application shall be at the sole expense of the applicant. In some instances peer reviews may be necessary to review particular studies and that the cost shall be at the expense of the applicant. The company to complete the peer review shall be selected by the County.

If the application is withdrawn prior to the circulation to commenting agencies, the entire original fee will be refunded. If withdrawn after the circulation to agencies, half the original fee will be refunded. No refund is available after the public meeting and/or approval of application.

Notification Sign Requirements

Planning Department staff may post a notification sign on your property in advance of the public meeting on your behalf. Please keep this sign posted until you have received a notice in the mail indicating that the Secretary Treasurer received no appeals. However, it is the applicant's responsibly to ensure that the sign is correctly posted within the statutory timeframes, according to the *Planning Act*. Failure to post a sign in advance of the public meeting in accordance with statutory requirements will impact the timing of your application at the Committee of Adjustment meeting. Applicants are responsible for removal of the sign following the appeal period. The signs are recyclable and can be placed in your blue box.

As requested, we have completed our review of the structural items listed in this report. An allowable soil bearing pressure of 2000psf was assumed. All structural steel to have a F_y=345MPa or greater. All lumber to be S-P-F No.1/No.2 or better. All structural composite lumber (SCL) to be 2.0E with F_b=2950 (USA ASD) or F_b=5450 (Canadian LSD) or greater. Inspections of the items in this report are by others. This report is for the above referenced project only and cannot be used for similar applications on other projects without written consent from Strik Baldinelli Moniz.

Items

1. Existing Block Foundation Wall Height & Reinforcement

It is our understanding that the existing concrete block foundation wall requires an additional block course to be added to the top of the existing wall to achieve the required foundation wall height above finished grade. Add 1 additional course of 6" concrete block course atop the existing concrete block wall and provide full height 1-15M vertical bars at max 54" o/c installed in the centre of the block cores. Fully grout cores of the existing block wall and new top course solid w/ non-shrink grout.

We trust this report meets your satisfaction; if you need further clarification please do not hesitate to contact us.

Items

[1]1. Existing Block Foundation Wall Height & Reinforcement with Water Pressure

Approx. Unsupported Wall Height = 5'-2"

It is our understanding that the existing concrete block foundation wall requires additional block courses to be added to the top of the existing wall to achieve the required foundation wall height above finished grade and to also be reinforced to resist flood water pressure. Add additional courses of 8" concrete block course atop the existing concrete block wall (as required). Provide 1-15M vertical bars at 8" o/c installed in the centre of the block cores (min. 1-15M bar in each cell). Fully grout cores of the existing block wall and additional top courses solid w/ non-shrink grout. Provide 5/8" diameter x 10" long with 1" hook anchor bolts are to be installed at the top of wall at ***16" o/c.*** *Wall top plate to be 2"x6" minimum with sill plate permitted to overhang the inside face of the foundation wall 1/3rd plate width max. Bottom of foundation wall will be laterally supported by concrete floor slab or compact soil in crawl space and covered as per OBC Part 9.*

Please note that the crawlspace slab (if installed) will not be able to support hydrostatic uplift pressures in the case of a flood in this area. The owner is to expect the crawlspace to flood and there will be a good chance of damage to the concrete floor slab (if installed) in the event of the flood. Strik, Baldinelli Moniz Ltd are only certifying the design of the lateral earth and water pressures on the existing block foundation walls and are not responsible for any damage caused by the flood event to the structural elements of the cottage & garage.

Design Assumptions:
K_a = 0.3
Soil Density = 110 pcf
Maximum Water Height in Design = Top of Foundation

We trust this report meets your satisfaction; if you need further clarification please do not hesitate to contact us.

Re: Floodproofing Design – New Foundations Only
84 Old Cut Blvd,
Port Rowan, ON
Re: Foundations
Our File: 23-15-0219

Dear Sir/Madam:

Our office completed the review and design of the new foundations for the above mentioned address. The design includes following items to ensure that the new foundations are adequate for the floodplain elevation given and the potential hydrostatic pressures:

1) The design of the new foundations is based on a min. bearing capacity of 3000 psf.
2) The footing size has been increased to 30”x12” with dowels into the foundation wall.
3) The foundation wall has been designed as a cantilevered wall and has both horizontal and vertical bars, as noted on the drawings.
4) The review existing foundations and the design of the extension of the existing foundations are by others,

If there are any questions or concerns, please do not hesitate to contact us at your convenience. Thank you.

Yours truly,
Santarelli Engineering Services

Cassidy;

As requested, we have completed our review of the structural items listed in this report. An allowable soil bearing pressure of 2000psf was assumed. All structural steel to have a F_y=345MPa or greater. All lumber to be S-P-F No.1/No.2 or better. All structural composite lumber (SCL) to be 2.0E with F_b=2950 (USA ASD) or F_b=5450 (Canadian LSD) or greater. Inspections of the items in this report are by others. Please contact us if additional engineering or inspections are required. See structural specification sheet SS1 attached for structural requirements, material specifications, loading, and assumptions. This report is for the above referenced project only and cannot be used for similar applications on other projects without written consent from Strik Baldinelli Moniz.

Items

[1]1. Existing Block Foundation Wall Height & Reinforcement with Water Pressure

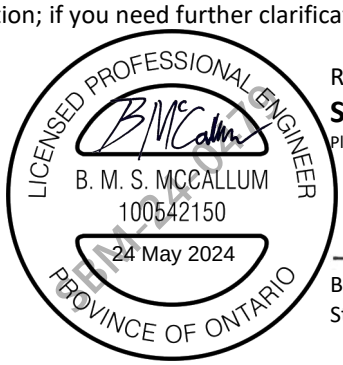
Approx. Unsupported Wall Height = 5'-2"

It is our understanding that the existing concrete block foundation wall requires additional block courses to be added to the top of the existing wall to achieve the required foundation wall height above finished grade and to also be reinforced to resist flood water pressure. Add additional courses of 8" concrete block course atop the existing concrete block wall (as required). Provide 1-15M vertical bars at 8" o/c installed in the centre of the block cores (min. 1-15M bar in each cell). Fully grout cores of the existing block wall and additional top courses solid w/ non-shrink grout. Provide 5/8" diameter x 10" long with 1" hook anchor bolts are to be installed at the top of wall at ***16" o/c.*** *Wall top plate to be 2"x6" minimum with sill plate permitted to overhang the inside face of the foundation wall 1/3rd plate width max. Bottom of foundation wall will be laterally supported by concrete floor slab or compact soil in crawl space and covered as per OBC Part 9.*

Please note that the crawlspace slab (if installed) will not be able to support hydrostatic uplift pressures in the case of a flood in this area. The owner is to expect the crawlspace to flood and there will be a good chance of damage to the concrete floor slab (if installed) in the event of the flood. Strik, Baldinelli Moniz Ltd are only certifying the design of the lateral earth and water pressures on the existing block foundation walls and are not responsible for any damage caused by the flood event to the structural elements of the cottage & garage.

Design Assumptions:
K_a = 0.3
Soil Density = 110 pcf
Maximum Water Height in Design = Top of Foundation

We trust this report meets your satisfaction; if you need further clarification please do not hesitate to contact us.



Regards,

Strik, Baldinelli, Moniz Ltd.
